## I. Actual and Natural Rate of Unemployment for All States

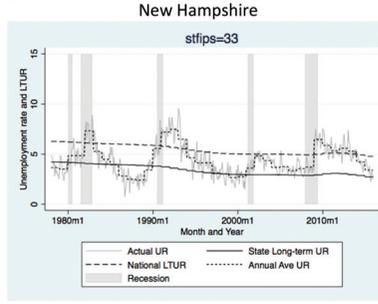

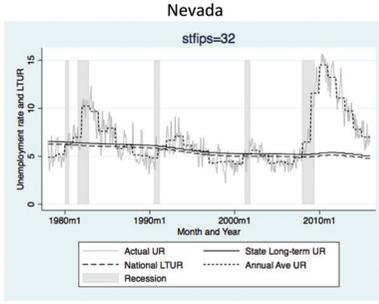

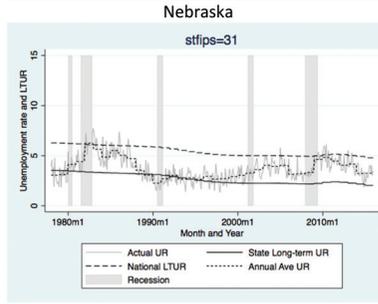

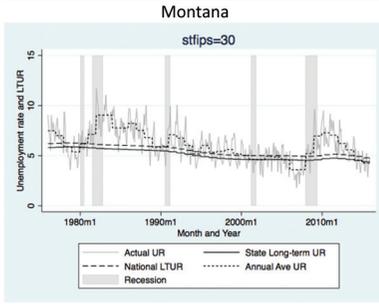

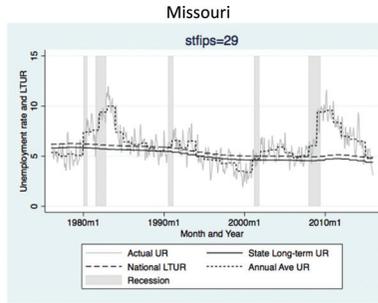

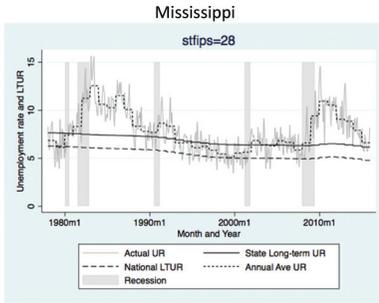

The graphs on the following pages illustrate natural unemployment rates for each state.

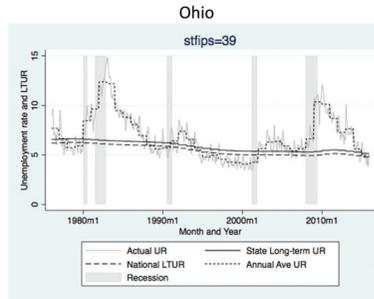

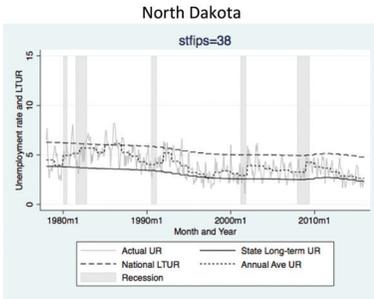

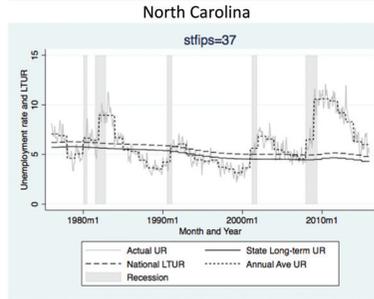

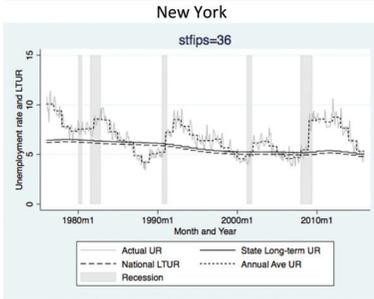

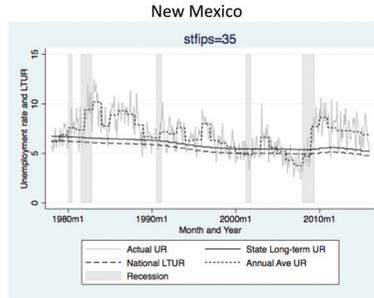

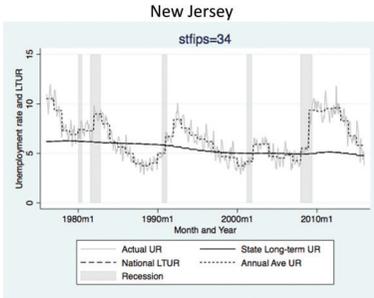

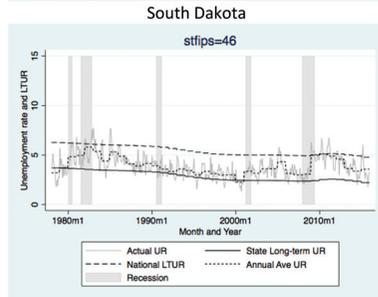

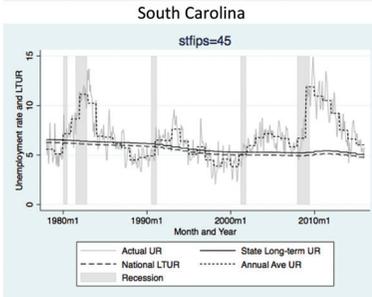

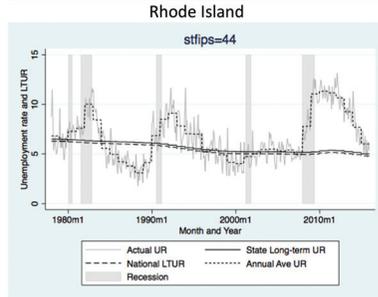

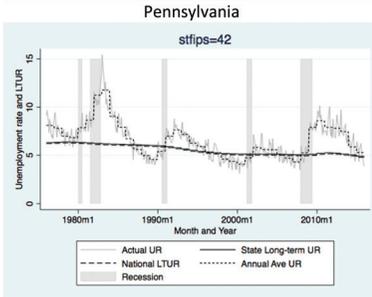

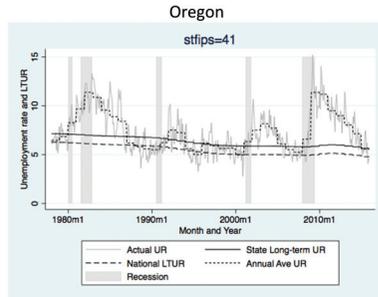

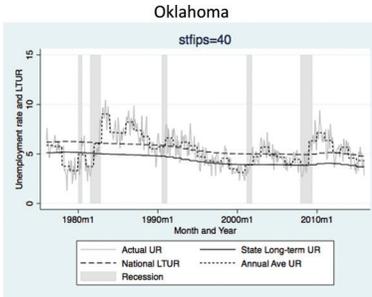

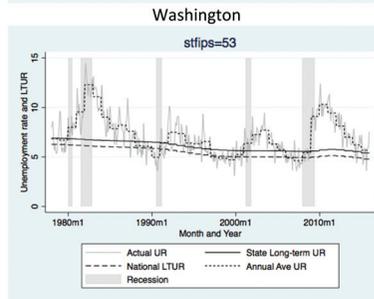

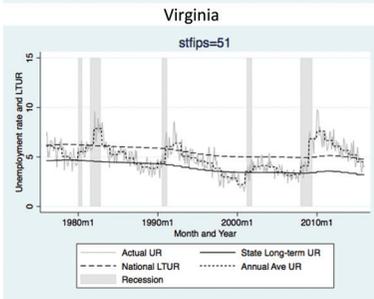

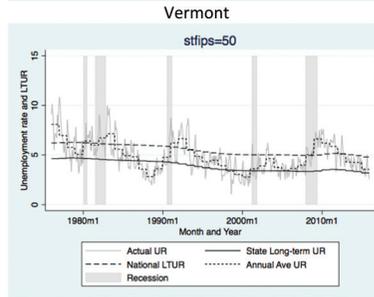

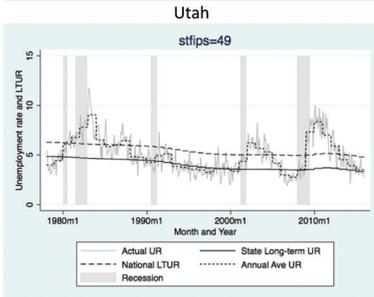

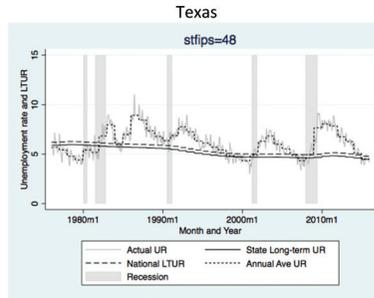

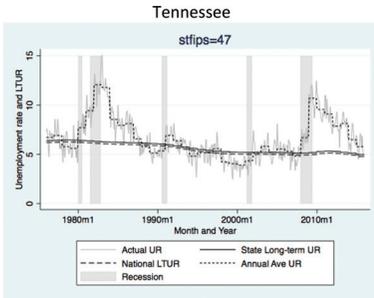

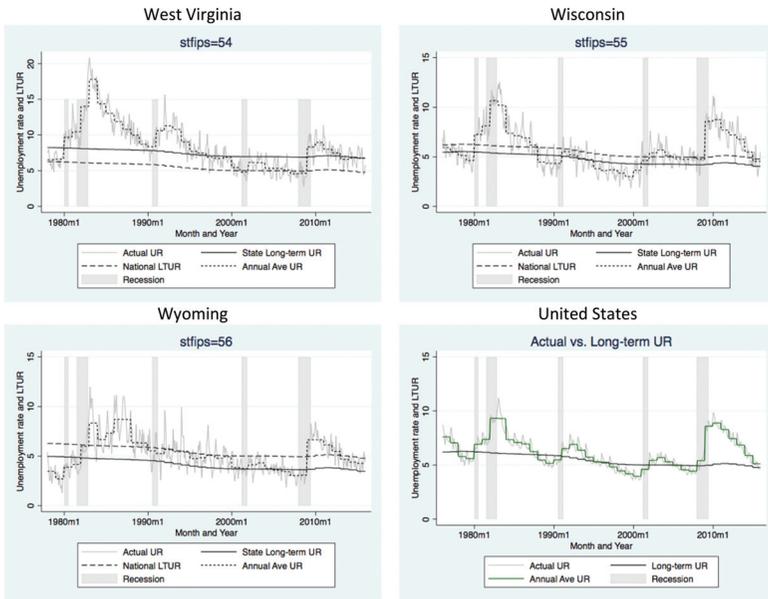

## II. Description of Sample Construction

Public data are obtained from the National Longitudinal Survey of Youth (NLSY) Investigator page: <https://www.nlsinfo.org/investigator/pages/login.jsp>. Data from the 1979 and 1997 surveys are pulled separately. Differences in variable definitions (such as race) are synthesized and the two survey observations are merged together.

Restricted state identifiers are obtained through an application process with the Bureau of Labor Statistics. Details can be found here: <https://www.bls.gov/rda/restricted-data.htm>.

The NLSY records weekly activity from which the annual number of weeks unemployed, out of the labor force, and employed are constructed.

For the 1979 cohort, hourly pay and weekly hours of work are collected for up to five jobs during the year. The person's "main" job is defined as the one on which he/she worked the most number of hours. It is for that job that hourly pay and hours of work are used for those analyses.

For the 1997 cohort, hourly pay and weekly hours of work are collected for up to seven jobs during the year. The person's "main" job during the year is identified by NLSY, and the hourly pay and hours of work corresponding to that job are used for those analyses.

There are a total of 335,501 potential observations with non-missing state identifiers between the ages of 18 and 57 (the oldest among the respondents from the NLSY79). There are 110,165 person/year observations missing a state identifier (76 percent of those missing observations are from the NLSY79).

Restricting the sample to those with non-missing demographics brings the number of person/year observations to 335,372.

#### *Additional Restrictions for $ushare$ and $olfshare$ Analysis*

- Restricting the sample to those who report at least 44 weeks of activity during the year decreases the potential sample size to 315,987.
- Non-missing  $ushare$  (requires some weeks in the labor force, in order to interpret as personal unemployment rate) and non-missing two- and four-year lagged values of gap = 214,458.
- Non-missing  $olfshare$  and non-missing two- and four-year lagged values of gap = 237,288.

#### *Additional Restrictions for Hourly Pay Analysis*

- Non-missing and non-zero total weeks of activity (less restrictive than  $ushare$  and  $olfshare$  analysis) = 320,064.
- Non-military = 319,674.
- Non-missing and non-zero hourly pay (at least one week of work and reported hourly pay) and non-missing two- and four-year lagged values of gap = 130,065.
- Non-outlier hourly pay (not in the bottom 1 percent or top 99 percent) = 127,366.
- Non-missing identifiers for selection equation (spouse earnings if married and number of children) = 116,686.
- Non-missing occupation and industry codes = 101,326.

III. Estimating Sample Means for Out of the Labor Force and Log Real Hourly Pay

Table III-1. Out of the Labor Force Analysis Sample

**Note:** Data are the 1979 and 1997 NLSY cohorts covering years 1982 through 2014. Dependent variable is share of time during a year spent out of the labor force (neither employed nor unemployed). Demographic-specific results are estimated by a fully interactive model, allowing the impact for all demographics, in addition to the impact of the gap period, to differ by demographic group (controlling for the rest of the demographics). Sample sizes for each of the groups are noted below the group label. Time, state, and individual fixed effects are included and standard errors are clustered at the state level. Hot and cold periods are also interacted with the year of the economic episode and its squared term.
